
Practical -8

Aim:

To Implement of Graph and Searching (DFS and BFS).

Theory:

Depth-First Search (DFS): This algorithm explores as deep as possible along each branch before backtracking. It naturally uses a Stack data structure (implemented via recursion or an explicit list).

Breadth-First Search (BFS): This algorithm explores the graph level-by-level, visiting all immediate neighbors before moving deeper. It uses a Queue (First-In, First-Out) data structure.

Algorithm:

1. Algorithm for DFS

Algorithm: DFS(G, v)

1. Start.
2. Mark vertex v as visited.
3. Display vertex v .
4. For every adjacent vertex u of v :
 - If u is not visited, call DFS(G, u).
5. Stop.

2. Algorithm for BFS

Algorithm: BFS(G, v)

1. Start.

2. Create an empty queue.
3. Mark the starting vertex v as visited.
4. Insert v into the queue.
5. While the queue is not empty:
 - Remove a vertex v from the queue.
 - Display v.
 - For every adjacent vertex u:
 - If u is not visited:
 - Mark u as visited.
 - Insert u into the queue.
6. Stop.

Program Code

```
#include <iostream>

#include <vector>

#include <queue>

using namespace std;

// DFS function

void DFS(int vertex, vector<vector<int>>& graph,
        vector<bool>& visited, int n) {
```

```
// Mark current vertex as visited

visited[vertex] = true;

// Print current vertex

cout << vertex << " ";

// Visit all adjacent vertices
for (int i = 0; i < n; i++) {
    if (graph[vertex][i] == 1 && !visited[i]) {
        DFS(i, graph, visited, n);
    }
}

}

// BFS function

void BFS(int start, vector<vector<int>>& graph, int n) {

    vector<bool> visited(n, false);

    queue<int> q;
```

```
// Mark starting vertex as visited
```

```
visited[start] = true;
```

```
// Insert starting vertex into queue
```

```
q.push(start);
```

```
while (!q.empty()) {
```

```
    // Remove vertex from queue
```

```
    int vertex = q.front();
```

```
    q.pop();
```

```
    // Print vertex
```

```
    cout << vertex << " ";
```

```
    // Visit all adjacent vertices
```

```
    for (int i = 0; i < n; i++) {
```

```
        if (graph[vertex][i] == 1 && !visited[i]) {
```

```
            visited[i] = true;
```

```
q.push(i);  
    }  
}  
}  
}  
}  
  
int main() {  
  
    int n, start;  
  
    cout << "Enter number of vertices: ";  
    cin >> n;  
  
    // Create adjacency matrix  
    vector<vector<int>> graph(n, vector<int>(n));  
  
    cout << "Enter adjacency matrix:\n";  
  
    for (int i = 0; i < n; i++) {  
        for (int j = 0; j < n; j++) {
```

```
cin >> graph[i][j];

    }

}

cout << "Enter starting vertex (0 to " << n - 1 << "): ";

cin >> start;

// DFS

vector<bool> visited(n, false);

cout << "\nDFS Traversal: ";

DFS(start, graph, visited, n);

// BFS

cout << "\nBFS Traversal: ";

BFS(start, graph, n);

cout<<"\nSangem vijayendra reddy\n";

cout<<"92460118171\n";

cout<<"5-EN18\n";
```

```
cout << endl;
```

```
return 0;
```

```
}
```

Result :

```
C:\Users\Admin\Downloads\d X + v
Enter number of vertices: 4
Enter adjacency matrix:
1 1 1 1
1 0 0 1
0 0 1 1
1 1 1 1
Enter starting vertex (0 to 3): 2

DFS Traversal: 2 3 0 1
BFS Traversal: 2 3 0 1
Sangem vijayendra reddy
92460118132
5-EN18

Process returned 0 (0x0) execution time : 37.465 s
Press any key to continue.
